

Changes made to Arden grammar to develop the new expression syntax

- Defined id (variable name) to optionally include a dot separator (e.g. cough.critical_time.low)
- Defined function call to be id.id(...) (e.g., Math.sin(3.14159))
- We do *not* yet have a way of declaring a class and its members. We believe it is necessary to have input from others on this.
- Got rid of interval as basic type. It can be reincarnated as a built-in class of the expression language
- Got rid of months and year as duration units but duration is still a basic type
- Extract <duration> functions will be moved to duration class
- Got rid of many synonyms from Arden
- Got rid of many temporal operators like latest, earliest, is before, was before, are before, were before etc. Some of these could become member functions of the relevant class(es).
- Replaced list operators and functions with List class functions
- Made "is Boolean", etc to "is instance of"
- Added let statement
- We have nested lists
- Removed unit from number type. We do not know how to convert between different units. Perhaps, need a subclass for physical quantity. Units were added on by InterMed; they were NOT part of Arden anyways.

Example

Old incorrect expression syntax:

```
latest Productive_Cough.critical_time.high >= now
```

New unproven expression syntax:

```
sorted_productive_cough :=  
Productive_Cough.sortDescending(Observation.getComparator("CriticalTime  
High"));
```

```
sorted_productive_cough.first() >= now
```

Notes:

Productive_Cough is of class List (a newly defined class in the "GLIF.USAM package") containing elements of class Observation as defined in USAM. A list can sort its elements in ascending or descending order based on a comparator defined in the class of its member elements. The comparator can be retrieved by the getComparator function of a class. Observation has a member variable called critical_time which has member variables called high and low. Observation provides comparators for sorting on these high and low variables.

CoughStudy_00259 (instance of Three_Valued_Criterion)

Name

productive cough

Specification

sorted_productive_cough :=

productive_cough.sortDescending(Observation.

getComparator("CriticalTimeLow")); .critical_time.high

sorted_productive_cough.first() >= now

Encoding Language

GLIF_Arden
